

FIRE ALARM (and temperature sensor)

Do you wonder what temperature your room is, do you want if a fire starts something to detect and buzz you from your sleep well that's what this is here for.

To start off we have the Wiring:

Basically all we do here is connect each sensor to power and then proceed with attaching each one to a GPIO Pin and Ground

This leaves us room to then use the code to produce our desired results

CODE:

is on the other part of the github with notes.
